

# RISK MANAGEMENT SEMINAR SERIES 2010

**Probability does not exist. Yet in the absence of symmetrical or homogenous data, people may still somehow quantify their uncertainties and act on the basis of probability for most business decisions.**

These maxims are qualified by an understanding of risk as defined by Exposure and Uncertainty. Risk, is then an exposure to a proposition of which one is uncertain. GIA has collaborated with NTU's Risk Management Society to present a 4-part series of talks to discuss the constant and dramatic changes shaping the business and regulatory environment for the Financial Risk industry. The first session will focus on Key Protection for Professionals during times of uncertainties and managing risk exposures in the corporate world.
